

TOP LIGHT SOURCE DEVICE

ABSTRACT OF THE INVENTION

This invention provides a backlight device which includes at least:
5 a photo conductive plate used for visible light to go through; a point
light source, which is beside the photo conductive plate, used for
producing visible light; a first diffusing top, which is beside the photo
conductive plate, used for diffusing the visible light from the point light
source to the lighting method of uniform line light source; a second
10 diffusing top, which is on the bottom of the photo conductive plate,
used for diffusing the visible light from the first diffusing top to the
lighting method of uniform top light source; a diffusing reflect objective,
which is below the photo conductive plate, used for diffusing the light
and then reflecting the diffused light to the photo conductive plate.
